

# Probability

$$\textcircled{H/T} \rightarrow H$$
$$P(\frac{\text{Share of } H}{\text{Total}}) = \frac{H}{H,T} = \frac{1}{2}$$

- ① Experiment  $\rightarrow$  A repeatable procedure with a set of possible results.  $\nexists$  tossing a coin
- ② Sample space  $\rightarrow$  All possible outcome of an experiment.  
Sample space — Head & tail.
- ③ Event  $\rightarrow$  One or more outcome of Experiment.

## \* Basic counting principle ✓

$\rightarrow$   $m$  ways to do one thing  
and  $n$  way to do another thing  
then there are total  $m \times n$  ways to do  
both the things.

$$P(H) = \frac{1}{2} = 0.5$$

✓ 3 shirts,  
✓ 4 jeans

$\rightarrow 3 \times 4 \rightarrow$  Unique combination

3 icecream flavour — 4 cones  $\rightarrow 4 \times 3 = \underline{12}$

## More than two choices

option 1  $\rightarrow$  Sedan or SUV

option 2  $\rightarrow C_1, C_2, C_3, C_4, C_5$

option 3  $\rightarrow$  3 model ( $M_1, M_2, M_3$ )

$$2 \times 5 \times 3 = 30 \text{ ways.}$$

independent event

— Basic counting  
work on independent  
event.

# Probability principles

What is probability??

Prob = Share of success / Total no of possible outcomes

→ Relative frequency of H

$$P(H) = \frac{1}{2}$$

Coin → 2

- ① The exact outcome cannot be predicted. (exception)
- ② All possible outcomes are known.
- ③ Equally likely outcomes.
- ④ Repeatable under uniform condition.

\* Probability rules

① for any event A,

$$0 \leq P(A) \leq 1$$

die → 1, 2, 3, 4, 5, 6

$$P(0) = 0$$

tossing a coin  
Success → (H, T)  
= total no of outcomes (H, T)

② Sum of all prob = 1.

$$P(H) + P(T) = 1$$

$$P(H) = 1 - P(T) \text{ (Rule of subtraction)}$$

③ Complement rule →

$$P(\text{not } A) = 1 - P(A)$$

#### ④ General addition rule

For any two event  
 $\rightarrow P(\underline{A \text{ or } B}) = P(A) + P(B) - P(A \text{ and } B)$

Special case of disjoint events  $\rightarrow P(A \text{ or } B) = \underline{P(A) + P(B)}$   
 $\downarrow$   
Can not occur Together

$$A + B - A \cap B$$

$$\downarrow$$

$$P(A \text{ and } B)$$

disjoint  $\rightarrow$

$$\underline{A \text{ and } B}$$

$$\downarrow$$

$$0$$

#### ⑤ General multiplication Rule

$$P(A \text{ and } B) = P(A) * P(B/A)$$

$$= P(B) * P(A/B)$$

Prob A when  
B has  
occurred

Special A and B are independent

$$P(A \text{ and } B) = P(A) * P(B)$$

$P(A/B)$

Conditional Prob

independent event  $\rightarrow$  does not affect each other

ex. I having breakfast and Mr Modi presenting a report in Lok Sabha  
 $\parallel$   
 10 am  $\longleftrightarrow$  10 am  
 $\neq$  I having breakfast / watching India winning the cricket test

disjoint  
 $\rightarrow$  no overlap  
 $\rightarrow$  sunrise in east & sunset in west

## Conditional prob

$$P(A/B) = \frac{P(A \cap B)}{P(B)}$$

Prob of A when B has occurred

$$P(A/B) = \frac{P(A \cap B)}{P(B)}$$

16 people study French, 21 study Spanish  
there are 30 people altogether.

Work on prob?

$$P(F) \rightarrow \frac{16}{30}$$

$$P(S) \rightarrow \frac{21}{30}$$

$$P(\text{French only}) \rightarrow \frac{9}{30}$$

$$P(\text{Spanish only}) \rightarrow \frac{14}{30}$$

$$P(F \text{ or } S) \rightarrow \frac{7}{30}$$

$$P(F \text{ and } S) \rightarrow \frac{7}{30}$$

$$\frac{30}{30} = 1$$

$$16-b + b + 21-b = 30$$

$$37-b = 30$$

$$b = 7$$

## Bayes Theorem

$$\text{Conditional Prob} = P(A/B) = \frac{P(A \cap B)}{P(B)}$$

$$P(B/A) = \frac{P(B \cap A)}{P(A)}$$

$$P(B/A) \cdot P(A) = P(B \cap A) \quad \text{--- ①}$$

$$P(A/B) \cdot P(B) = P(A \cap B) \quad \text{--- ②}$$

equation ① & ②

$$P(A/B) \cdot P(B) = P(B/A) \cdot P(A)$$

$$P(A/B) = \frac{P(B/A) \cdot P(A)}{P(B)}$$

what is prob and getting 3  $\rightarrow 1/6$

2 or 3  $\rightarrow 2/6 \Rightarrow 1/3$

① Union  $A = \{1, 2, 3\}$   
 $B = \{3, 4, 5\}$   
 $A \cup B = \{1, 2, 3, 4, 5\}$

② Intersection  $A \cap B = \{3\}$   
 $A \cap B \rightarrow A \cdot \text{Intersect}(B)$

③ difference  $A - B = \{1, 2\}$   
 $A - B \rightarrow A \cdot \text{difference}(B)$

④ Symmetric diff  $A \oplus B = \{1, 2, 4, 5\}$   
 $A \oplus B \rightarrow A \cdot \text{Symmetric diff}(B)$
